Scenario:
You are a software engineer living in the city of Seattle. You have a little dog at home who has an allergy and you can never find any food for it that doesn't seem to bother it. You'd like to find a cheap and healthy dog food that doesn't bother the dog.

Task 1: Take the survey to find the right food for your dog

Task 2: Go through the survey and save the dog food to your profile so you can purchase it at a later date

Task 3: Make your first purchase and write a review after giving the food to your dog (Have to extend prototype)

What changes should I make to the application
1) Add a review screen so that you can inform other potential buyers on a certain brand
2) Add a friends tab so you can see what other people are buying
3) Add a watch list tab so you can come back later to buy food

What should I keep in the application
1) Keep the survey so unsure buyers can explore options
2) Keep the delivery and pickup options available
3) Keep the user profile screen to view saved foods and past purchases
